THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO THE PUBLIC AFTER ISSUES ARE RESOLVED.

# Introduction

EtherAuthority was contracted by the Garfield INU (GFI) team to perform the Security audit of the Garfield INU (GFI) Token smart contract code. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on November 13th, 2021.

**The purpose of this audit was to address the following:**

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

## Project Background

Garfield INU (GFI) is a BEP20 standard token smart contract with other customization like: swapping, adding liquidity, reflation, Burn, etc. This audit only considers Garfield INU token smart contract, and does not cover any other smart contracts in the platform.

## Audit scope

<b>Name</b>	<b>Code Review and Security Analysis Report for Garfield INU (GFI) Token Smart Contract</b>
<b>Platform</b>	<b>BSC / Solidity</b>
<b>File</b>	GarfieldINU.sol
<b>File MD5 Hash</b>	F1B3B19ADA14A1F0AFD19CFDF3439F28
<b>Online code</b>	<a href="#">0xd5e5c8aba3ad1fe5db1ba786dae85815c9b47f19</a>
<b>Audit Date</b>	November 13th, 2021

## Claimed Smart Contract Features

Claimed Feature Detail	Our Observation
<b>Tokenomics:</b> <ul style="list-style-type: none"><li>• Name: Garfield INU</li><li>• Symbol: GFI</li><li>• Decimals: 18</li></ul>	<b>YES, This is valid.</b>
<ul style="list-style-type: none"><li>• Burn Fee: 1%</li><li>• Funding Fee: 9%</li><li>• Tax Fee: 2%</li><li>• Liquidity Fee: 2%</li><li>• Total Supply: 10 Trillion GFI</li><li>• Maximum Transaction Amount: 10 Trillion GFI</li><li>• Number Tokens Sell To Add To Liquidity: 50 Million GFI</li></ul>	<b>YES, This is valid.</b>  <b>Owner authorized wallet can set some percentage value and we suggest handling the private key of that wallet securely.</b>

## Audit Summary

According to the standard audit assessment, Customer's solidity smart contracts are **"Secured"**. This token contract does contain owner control, which does not make it fully decentralized.

We used various tools like Slither, Solhint and Remix IDE. At the same time this finding is based on critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit overview section. General overview is presented in AS-IS section and all identified issues can be found in the Audit overview section.

**We found 0 critical, 0 high, 0 medium and 5 low and some very low level issues. These issues are not critical ones.**

**Investors Advice:** Technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

## Technical Quick Stats

Main Category	Subcategory	Result
Contract Programming	Solidity version not specified	Passed
	Solidity version too old	Passed
	Integer overflow/underflow	Passed
	Function input parameters lack of check	Moderated
	Function input parameters check bypass	Passed
	Function access control lacks management	Passed
	Critical operation lacks event log	Moderated
	Human/contract checks bypass	Passed
	Random number generation/use vulnerability	N/A
	Fallback function misuse	Passed
	Race condition	Passed
	Logical vulnerability	Passed
	Features claimed	Passed
	Other programming issues	Moderated
Code Specification	Function visibility not explicitly declared	Passed
	Var. storage location not explicitly declared	Passed
	Use keywords/functions to be deprecated	Passed
	Unused code	Passed
Gas Optimization	"Out of Gas" Issue	Passed
	High consumption 'for/while' loop	Moderated
	High consumption 'storage' storage	Passed
	Assert() misuse	Passed
Business Risk	The maximum limit for mintage not set	Passed
	"Short Address" Attack	Passed
	"Double Spend" Attack	Passed

Overall Audit Result: **PASSED**

## Code Quality

This audit scope has 1 smart contract file. Smart contract contains Libraries, Smart contracts, inherits and Interfaces. This is a compact and well written smart contract.

The libraries in Garfield INU (GFI) Token are part of its logical algorithm. A library is a different type of smart contract that contains reusable code. Once deployed on the blockchain (only once), it is assigned a specific address and its properties / methods can be reused many times by other contracts in the Garfield INU (GFI) Token.

The Garfield INU (GFI) Token team has **not** provided scenario and unit test scripts, which would have helped to determine the integrity of the code in an automated way.

Code parts are **not** well commented on smart contracts.

## Documentation

We were given a Garfield INU (GFI) Token smart contracts code in the form of a BSCscan web link. The hash of that code is mentioned above in the table.

As mentioned above, code parts are **not well** commented. So it is not easy to quickly understand the programming flow as well as complex code logic. Comments are very helpful in understanding the overall architecture of the protocol.

## Use of Dependencies

As per our observation, the libraries are used in this smart contract infrastructure that are based on well known industry standard open source projects.

Apart from libraries, its functions are used in external smart contract calls.

# AS-IS overview

## Functions

Sl.	Functions	Type	Observation	Conclusion
1	constructor	write	Passed	No Issue
2	lockTheSwap	modifier	Passed	No Issue
3	name	read	Passed	No Issue
4	symbol	read	Passed	No Issue

19	excludeFromReward	write	access only Owner	No Issue
20	includeInReward	external	Infinite loop	Refer Audit Findings
21	_transferBothExcluded	write	Function input parameters lack of check	Refer Audit Findings
22	receive	external	Passed	No Issue
23	_reflectFee	write	Function input parameters lack of check	Refer Audit Findings
24	_getValues	read	Passed	No Issue
25	getTValues	read	Passed	No Issue
26	getRValues	write	Passed	No Issue
27	getRate	read	Passed	No Issue
28	_getCurrentSupply	read	Infinite loop	Refer Audit Findings

29	_takeLiquidity	write	Function input parameters lack of check	Refer Audit Findings
30	calculateTaxFee	read	Function input parameters lack of check	Refer Audit Findings
31	calculateLiquidityFee	read	Function input parameters lack of check	Refer Audit Findings
32	removeAllFee	write	Passed	No Issue
33	restoreAllFee	write	Fees can be reset by the old value	Refer Audit Findings
34	isExcludedFromFee	read	Passed	No Issue
35	_approve	write	Passed	No Issue
36	_transfer	write	Passed	No Issue
37	swapAndLiquify	write	Passed	No Issue
38	swapTokensForEth	write	Passed	No Issue
39	addLiquidity	write	Centralized risk in addLiquidity	Refer Audit Findings
40	_tokenTransfer	write	Fees can be reset by the old value	Refer Audit Findings
41	transferStandard	write	Passed	No Issue
42	_transferToExcluded	write	Function input parameters lack of check	Refer Audit Findings
43	_transferFromExcluded	write	Function input parameters lack of check	Refer Audit Findings
44	excludeFromFee	write	access only Owner	No Issue
45	includeInFee	write	access only Owner	No Issue
46	setTaxFee	external	access only Owner	No Issue
47	setBurnFee	external	access only Owner	No Issue
48	setLiquidityFee	external	access only Owner	No Issue
49	setCharityWallet	external	Critical operation lacks event log	Refer Audit Findings
50	setDevWallet	external	Critical operation lacks event log	Refer Audit Findings
51	setnumTokensSellToAddTo Liquidity	external	access only Owner	No Issue
52	setMarketingWallet	external	Critical operation lacks event log	Refer Audit Findings

<b>53</b>	setMaxTxPercent	external	access only Owner	No Issue
<b>54</b>	setSwapAndLiquifyEnabled	write	access only Owner	No Issue
<b>55</b>	owner	read	Passed	No Issue
<b>56</b>	onlyOwner	modifier	Passed	No Issue
<b>57</b>	renounceOwnership	write	Possible to gain ownership	Refer Audit Findings
<b>58</b>	transferOwnership	write	access only Owner	No Issue
<b>59</b>	geUnlockTime	read	Passed	No Issue
<b>60</b>	lock	write	Possible to gain ownership	Refer Audit Findings
<b>61</b>	unlock	write	Possible to gain ownership	Refer Audit Findings

## Severity Definitions

Risk Level	Description
<b>Critical</b>	Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc.
<b>High</b>	High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial
<b>Medium</b>	Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose
<b>Low</b>	Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution
<b>Lowest / Code Style / Best Practice</b>	Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored.

# Audit Findings

## Critical Severity

No Critical severity vulnerabilities were found.

## High Severity

(1) Fees can be reset by the old value:

```
//Restore tax, liquidity, burn and funding fees
_taxFee = _previousTaxFee;
_liquidityFee = _previousLiquidityFee;
_fundingFee = _previousFundingFee;

if(!_isExcludedFromFee[sender] || !_isExcludedFromFee[recipient])
    restoreAllFee();

function restoreAllFee() private {
    _taxFee = 2;
    _liquidityFee = 2;
    _burnFee = 1;
    _fundingFee = 9;
}
```

In `_tokenTransfer` function, these 2 fees are reset to previously set fees which never get reset by the new fees set using `setTaxFee`, `setLiquidityFee`.

Also the 3 fees are reset again in `restoreAllFee()` function. which can consume gas.

In `restoreAllFee`, the fees are restored by static values.

**Resolution:** We suggest resetting `_previousTaxFee` and `_previousLiquidityFee` variables when `_taxFee` and `_liquidityFee` get changed by the owner. Instead of resetting these 3 fees twice, restore just the burn fee for excludedfromfee condition.

```
function setTaxFee(uint newFee) external onlyOwner() {
    _taxFee = newFee;
}

function setBurnFee(uint newFee) external onlyOwner() {
    _burnFee = newFee;
}

function setLiquidityFee(uint newFee) external onlyOwner() {
    _liquidityFee = newFee;
}
```

## Medium

No medium severity vulnerabilities were found.

## Low

(1) Centralized risk in addLiquidity:

```
function addLiquidity(uint256 tokenAmount, uint256 ethAmount) private {  
    // approve token transfer to cover all possible scenarios  
    _approve(address(this), address(uniswapV2Router), tokenAmount);  
  
    // add the liquidity  
    uniswapV2Router.addLiquidityETH{value: ethAmount}(  
        address(this),  
        tokenAmount,  
        0, // slippage is unavoidable  
        0, // slippage is unavoidable  
        owner(),  
        block.timestamp  
    );  
}
```

In addLiquidity(), owner() function, the owner gets GFI Tokens from the Pool. If the private key of the owner's wallet is compromised, then it will create a problem.

**Resolution:** Ideally this can be a governance smart contract. On another hand, the owner can accept this risk and handle the private key very securely.

(2) Infinite loops possibility:

As array elements will increase, then it will cost more and more gas. And eventually, it will stop all the functionality. After several hundreds of transactions, all those functions depending on it will stop. We suggest avoiding loops. For example, use mapping to store the array index. And query that data directly, instead of looping through all the elements to find an element.

**Resolution:** Adjust logic to replace loops with mapping or other code structure.

- includeInReward() - \_excluded.length.
- \_getCurrentSupply() - \_excluded.length.

(3) Function input parameters lack of check:

Some functions require validation before execution.

Functions are:

- deliver

- setBurnFee
- setLiquidityFee
- setTaxFee
- setCharityWallet
- setDevWallet
- setMarketingWallet

**Resolution:** We suggest using validation like for numerical variables that should be greater than 0 and for address type check variables that are not address(0). For percentage type variables, values should have some range like minimum 0 and maximum 100.

(4) Possible to gain ownership:

Possible to gain ownership after renouncing the contract ownership. Owner can renounce ownership and make contract without owner but he can regain ownership by following the steps below:

1. Owner calls the lock function in contract to set the current owner as `_previousOwner`.
2. Owner calls unlock to unlock the contract and set `_owner = _previousOwner`.
3. Owner called `renounceOwnership` to leave the contract without the owner.
4. Owner calls unlock to regain ownership.

**Resolution:** We suggest removing these lock/unlock functions as this seems not serving a great purpose. Otherwise, always renounce ownership before calling the lock function.

(5) Gas Efficiency:

When the contract enters the branch `else if (!_isExcluded[sender] && !_isExcluded[recipient])`, the contract will execute the same piece of code `_transferStandard(sender, recipient, (amount.sub(burnAmt).sub(fundingAmt)));`

```

//this method is responsible for taking all fee, if takeFee is true
function _tokenTransfer(address sender, address recipient, uint256 amount) private {
    if(!_isExcludedFromFee[sender] || !_isExcludedFromFee[recipient]){
        removeAllFee();
    }
    else{
        require(amount <= _maxTxAmount, "Transfer amount exceeds the maxTxAmount.");
    }

    //Calculate burn amount and funding amount
    uint256 burnAmt = amount.mul(_burnFee).div(100);
    uint256 fundingAmt = amount.mul(_fundingFee).div(100);
    uint256 fundingPiece = fundingAmt.div(9);

    if (_isExcluded[sender] && !_isExcluded[recipient]) {
        _transferFromExcluded(sender, recipient, (amount.sub(burnAmt).sub(fundingAmt)));
    } else if (!_isExcluded[sender] && _isExcluded[recipient]) {
        transferToExcluded(sender, recipient, (amount.sub(burnAmt).sub(fundingAmt)));
    } else if (!_isExcluded[sender] && !_isExcluded[recipient]) {
        _transferStandard(sender, recipient, (amount.sub(burnAmt).sub(fundingAmt)));
    } else if (_isExcluded[sender] && _isExcluded[recipient]) {
        _transferBothExcluded(sender, recipient, (amount.sub(burnAmt).sub(fundingAmt)));
    } else {
        _transferStandard(sender, recipient, (amount.sub(burnAmt).sub(fundingAmt)));
    }
}

```

**Resolution:** We suggest removing this code to reduce some gas.

### Very Low / Informational / Best practices:

(1) Make variables constant:

```

string private _name = "Garfield INU";
string private _symbol = "GFI";
uint8 private _decimals = 18;

```

These variables will be unchanged. So, please make it constant. It will save some gas.

**Resolution:** Declare those variables as constant. Just put a constant keyword.

(2) Transfer all tokens from Charity wallet:

Charity wallet cannot transfer his all tokens.

**Resolution:** If it is a part of the plan then disregard this issue otherwise the owner has to set charity wallet as excluded from fee.

(3) Visibility can be external over public:

Any functions which are not called internally, should be declared as external. This saves some gas and is considered a good practice.

<https://ethereum.stackexchange.com/questions/19380/external-vs-public-best-practices>

(4) Unused event:

```
event MinTokensBeforeSwapUpdated(uint256 minTokensBeforeSwap);
```

MinTokensBeforeSwapUpdated event is defined but not used in code.

**Resolution:** We suggest removing unused event.

(5) Critical operation lacks event log:

Missing event log for:

- deliver
- setCharityWallet
- setDevWallet
- setMarketingWallet

**Resolution:** Please write an event log for listed events.

# Centralization

This smart contract has some functions which can be executed by the Admin (Owner) only. If the admin wallet private key would be compromised, then it would create trouble.

Following are Admin functions:

- `excludeFromReward`: Owner can check if the account is already excluded from rewards or not and set status true.
- `includeInReward`: Owner can check if the account is already excluded from rewards or not and set status false.
- `excludeFromFee`: Owner can set exclude account true.
- `includeInFee`: Owner can exclude account false.
- `setTaxFee`: Owner can set new tax fee.
- `setBurnFee`: Owner can set new burn fee.
- `setLiquidityFee`: Owner can set new liquidity fee.
- `setCharityWallet`: Owner can set new charity wallet.
- `setDevWallet`: Owner can set new dev wallet.
- `setnumTokensSellToAddToLiquidity`: Owner can set number of tokens sold to add new liquidity.
- `setMarketingWallet`: Owner can set marketing wallet.
- `setMaxTxPercent`: Owner can set percentage for maximum transaction amount.
- `setSwapAndLiquifyEnabled`: Owner can set swap and liquify enabled.

## Conclusion

We were given a contract code. And we have used all possible tests based on given objects as files. We observed some issues in the smart contracts, but they are not critical ones. So, **it's good to go to production**.

Since possible test cases can be unlimited for such smart contracts protocol, we provide no such guarantee of future outcomes. We have used all the latest static tools and manual observations to cover maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools. Smart Contract's high-level description of functionality was presented in the As-is overview section of the report.

Audit report contains all found security vulnerabilities and other issues in the reviewed code.

Security state of the reviewed contract, based on standard audit procedure scope, is **"Secured"**.

# Our Methodology

We like to work with a transparent process and make our reviews a collaborative effort. The goals of our security audits are to improve the quality of systems we review and aim for sufficient remediation to help protect users. The following is the methodology we use in our security audit process.

## **Manual Code Review:**

In manually reviewing all of the code, we look for any potential issues with code logic, error handling, protocol and header parsing, cryptographic errors, and random number generators. We also watch for areas where more defensive programming could reduce the risk of future mistakes and speed up future audits. Although our primary focus is on the in-scope code, we examine dependency code and behavior when it is relevant to a particular line of investigation.

## **Vulnerability Analysis:**

Our audit techniques included manual code analysis, user interface interaction, and whitebox penetration testing. We look at the project's web site to get a high level understanding of what functionality the software under review provides. We then meet with the developers to gain an appreciation of their vision of the software. We install and use the relevant software, exploring the user interactions and roles. While we do this, we brainstorm threat models and attack surfaces. We read design documentation, review other audit results, search for similar projects, examine source code dependencies, skim open issue tickets, and generally investigate details other than the implementation.

## **Documenting Results:**

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this we analyze the feasibility of an attack in a live system.

## **Suggested Solutions:**

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

# Disclaimers

## EtherAuthority.io Disclaimer

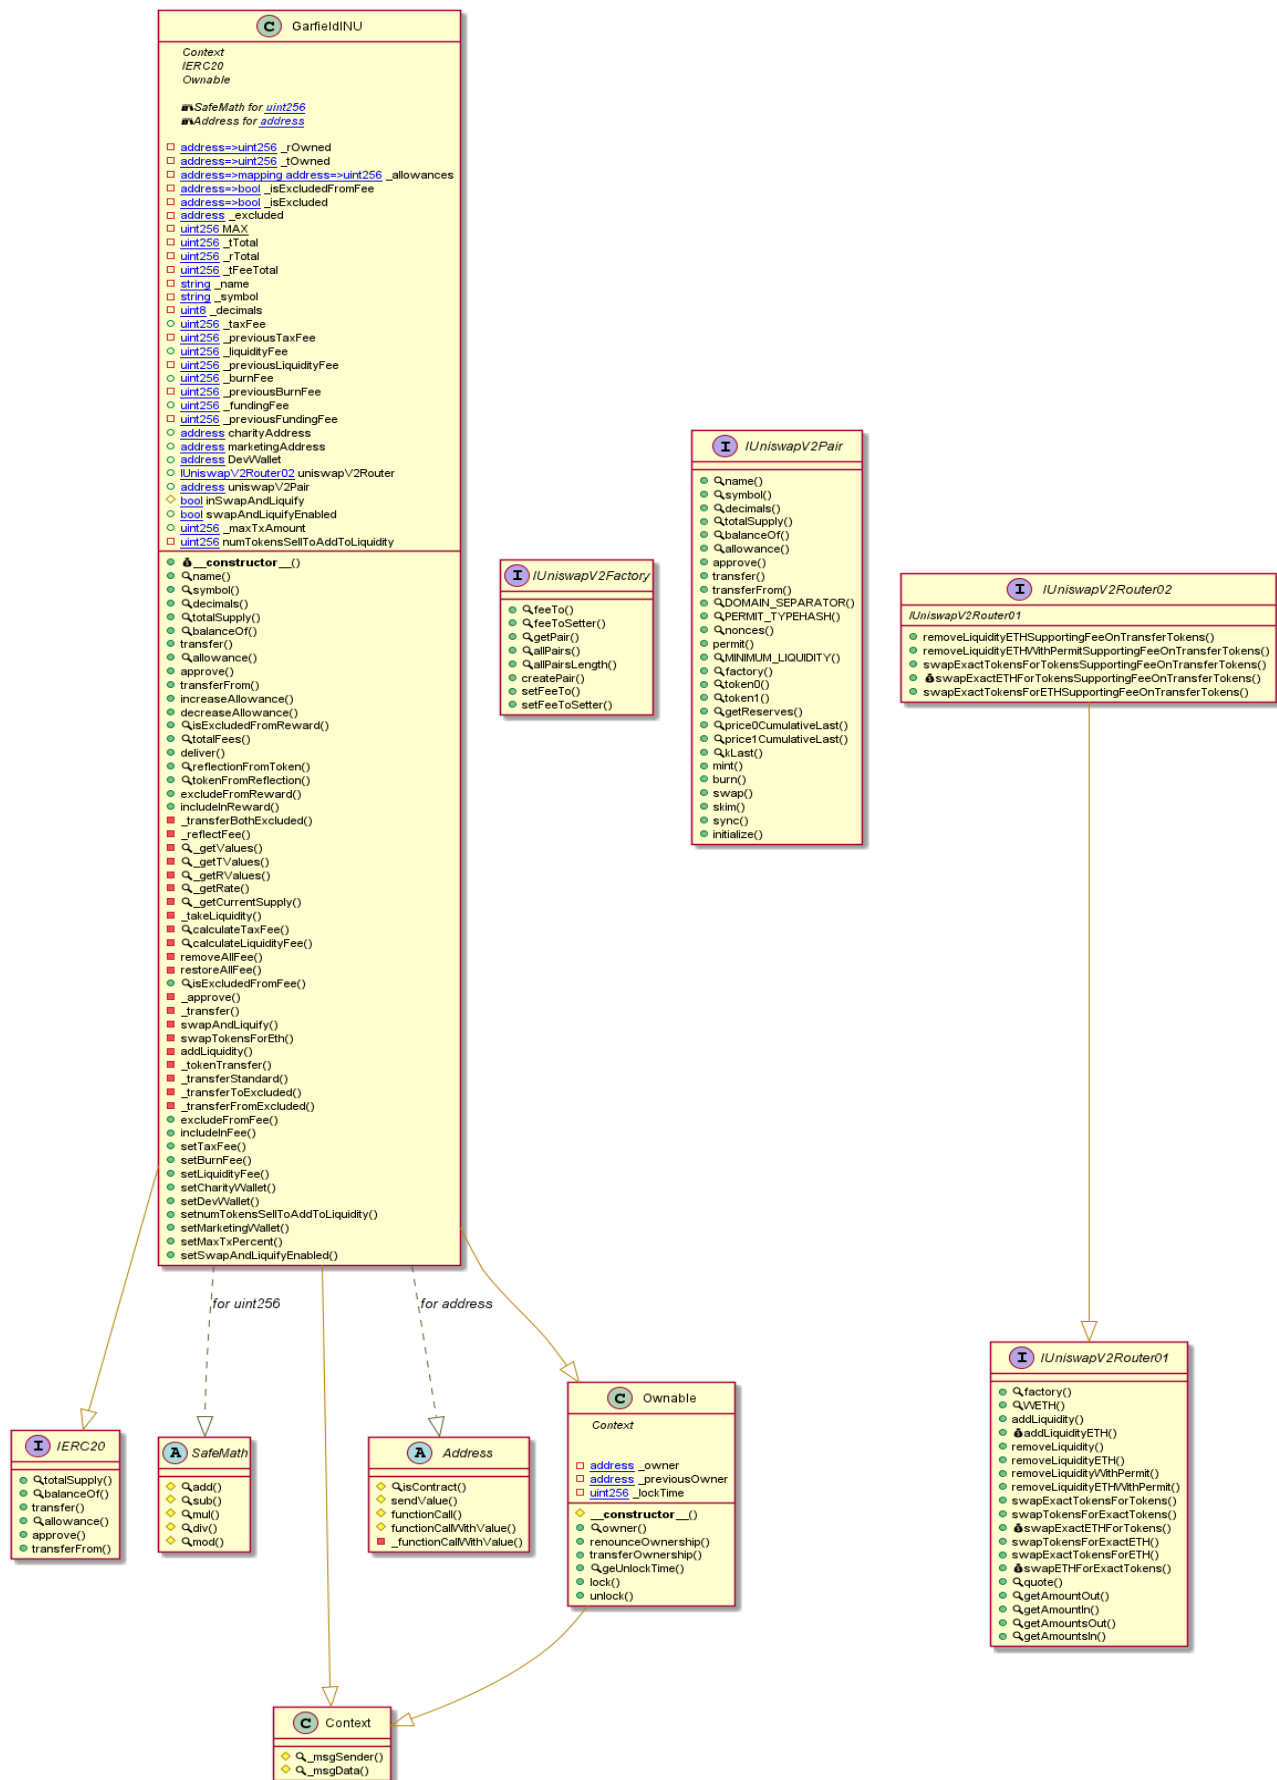

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

Due to the fact that the total number of test cases are unlimited, the audit makes no statements or warranties on security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bugfree status or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

## Technical Disclaimer

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee explicit security of the audited smart contracts.

# Solidity Static Analysis

## GarfieldINU.sol

### Security

#### Check-effects-interaction:

Potential violation of Checks-Effects-Interaction pattern in

Address.\_functionCallWithValue(address,bytes,uint256,string): Could potentially lead to re-entrancy vulnerability. Note: Modifiers are currently not considered by this static analysis.

[more](#)

Pos: 374:4:

#### Inline assembly:

The Contract uses inline assembly, this is only advised in rare cases.

Additionally static analysis modules do not parse inline Assembly, this can lead to wrong analysis results.

[more](#)

Pos: 288:8:

#### Block timestamp:

Use of "block.timestamp": "block.timestamp" can be influenced by miners to a certain degree.

That means that a miner can "choose" the block.timestamp, to a certain degree, to change the outcome of a transaction in the mined block.

[more](#)

Pos: 1058:12:

#### Low level calls:

Use of "call": should be avoided whenever possible.

It can lead to unexpected behavior if return value is not handled properly.

Please use Direct Calls via specifying the called contract's interface.

[more](#)

Pos: 312:27:

### Gas & Economy

#### Gas costs:

Gas requirement of function GarfieldINU.transferOwnership is infinite:

If the gas requirement of a function is higher than the block gas limit, it cannot be executed.

Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 457:4:

#### Gas costs:

Gas requirement of function GarfieldINU.uniswapV2Router is infinite:

If the gas requirement of a function is higher than the block gas limit, it cannot be executed.

Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 736:4:

### For loop over dynamic array:

Loops that do not have a fixed number of iterations, for example, loops that depend on storage values, have to be used carefully. Due to the block gas limit, transactions can only consume a certain amount of gas. The number of iterations in a loop can grow beyond the block gas limit which can cause the complete contract to be stalled at a certain point.

Additionally, using unbounded loops incurs in a lot of avoidable gas costs. Carefully test how many items at maximum you can pass to such functions to make it successful.

Pos: 875:8:

## ERC

### ERC20:

ERC20 contract's "decimals" function should have "uint8" as return type

[more](#)

Pos: 511:4:

## Miscellaneous

### Constant/View/Pure functions:

SafeMath.sub(uint256,uint256) : Is constant but potentially should not be. Note: Modifiers are currently not considered by this static analysis.

Pos: 133:4:

### Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

[more](#)

Pos: 839:8:

[more](#)

Pos: 858:8:

### Data truncated:

Division of integer values yields an integer value again. That means e.g.  $10 / 100 = 0$  instead of 0.1 since the result is an integer again. This does not hold for division of (only) literal values since those yield rational constants.

Pos: 173:16:

```

### Software analysis result:

These software reported many false positive results and some are informational issues. So, those issues can be safely ignored.
