THIS IS SECURITY AUDIT REPORT DOCUMENT AND WHICH MAY CONTAIN INFORMATION WHICH IS CONFIDENTIAL. WHICH INCLUDES ANY POTENTIAL VULNERABILITIES AND MALICIOUS CODES WHICH CAN BE USED TO EXPLOIT THE SOFTWARE. THIS MUST BE REFERRED INTERNALLY AND ONLY SHOULD BE MADE AVAILABLE TO THE PUBLIC AFTER ISSUES ARE RESOLVED.

# Introduction

As part of EtherAuthority's community smart contracts audit initiatives, the smart contracts of ANY Ethereum (anyETH) from anyswap.exchange were audited. The audit has been performed using manual analysis as well as using automated software tools. This report presents all the findings regarding the audit performed on January 5th, 2026.

**The purpose of this audit was to address the following:**

- Ensure that all claimed functions exist and function correctly.
- Identify any security vulnerabilities that may be present in the smart contract.

## Project Background

### 1. Token Type

This project is an **ERC20-compatible token** built on the BNB Smart Chain, enabling standard token transfers and balances.

### 2. Core Standard

It follows the OpenZeppelin ERC20 framework, ensuring widely accepted token behavior and security practices.

### 3. Swap Mechanism

The contract introduces Swapin and Swapout functions for **cross-chain asset transfers**.

### 4. Bridge Functionality

It acts as a **bridge token**, allowing assets to move between different blockchains via a centralized authority.

### 5. Minting Capability

Tokens are minted through the Swapin function, which is controlled by the contract owner.

### 6. Burn Mechanism

Tokens are burned using the Swapout function when users transfer assets out of the chain.

### 7. Ownership Control

The contract includes an onlyOwner modifier, giving administrative control to a single owner address.

#### 8. Delayed Ownership Transfer

Ownership changes are not immediate—they activate after a specific number of blocks, adding a delay mechanism.

#### 9. Security Measures

Uses SafeMath to prevent overflow/underflow issues in arithmetic operations.

#### 10. Centralized Trust Model

The system relies on a trusted owner for minting and bridging, meaning it is **not fully decentralized**.

## Audit scope

## Audit Summary

According to the standard audit assessment, the Customer's solidity-based smart contracts are "**Secured**". Also, these contracts contain owner control, which does not make them fully decentralized.

We used various tools like Slither, Solhint, and Remix IDE. At the same time, this finding is based on a critical analysis of the manual audit.

All issues found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the Audit Overview section. The general overview is presented in the AS-IS section and all identified issues can be found in the Audit overview section.

**We found 0 critical, 0 high, 0 medium 0 low, and 3 very low level issues.**

**Investor Advice:** A technical audit of the smart contract does not guarantee the ethical nature of the project. Any owner-controlled functions should be executed by the owner with responsibility. All investors/users are advised to do their due diligence before investing in the project.

## Technical Quick Stats

| Main Category        | Subcategory                                   | Result    |
|----------------------|-----------------------------------------------|-----------|
| Contract Programming | The solidity version is not specified         | Passed    |
|                      | The solidity version is too old               | Moderated |
|                      | Integer overflow/underflow                    | Passed    |
|                      | Function input parameters lack check          | Passed    |
|                      | Function input parameters check bypass        | Passed    |
|                      | Function access control lacks management      | Passed    |
|                      | Critical operation lacks event log            | Passed    |
|                      | Human/contract checks bypass                  | Passed    |
|                      | Random number generation/use vulnerability    | N/A       |
|                      | Fallback function misuse                      | Passed    |
|                      | Race condition                                | Passed    |
|                      | Logical vulnerability                         | Passed    |
|                      | Features claimed                              | Passed    |
|                      | Other programming issues                      | Moderated |
| Code Specification   | Function visibility not explicitly declared   | Passed    |
|                      | Var. storage location not explicitly declared | Passed    |
|                      | Use keywords/functions to be deprecated       | Passed    |
|                      | Unused code                                   | Passed    |
| Gas Optimization     | "Out of Gas" Issue                            | Passed    |
|                      | High consumption 'for/while' loop             | Passed    |
|                      | High consumption 'storage' storage            | Passed    |
|                      | Assert() misuse                               | Passed    |
| Business Risk        | The maximum limit for mintage is not set      | Passed    |
|                      | "Short Address" Attack                        | Passed    |
|                      | "Double Spend" Attack                         | Passed    |

**Overall Audit Result: PASSED**

## Code Quality

This audit scope has 1 smart contract. Smart contracts contain Libraries, Smart contracts, inherits, and Interfaces. This is a compact and well-written smart contract.

The libraries in ANY Ethereum Token are part of its logical algorithm. A library is a different type of smart contract that contains reusable code. Once deployed on the blockchain (only once), it is assigned a specific address and its properties/methods can be reused many times by other contracts in the ANY Ethereum.

The EtherAuthority team has no scenario and unit test scripts, which would have helped to determine the integrity of the code in an automated way.

Code parts are well commented on in the smart contracts. Ethereum's NatSpec commenting style is recommended.

## Documentation

We were given ANY Ethereum smart contract code in the form of a [bscscan](#) web link.

As mentioned above, code parts are well commented on. and the logic is straightforward. So it is easy to quickly understand the programming flow as well as complex code logic. Comments are very helpful in understanding the overall architecture of the protocol.

## Use of Dependencies

As per our observation, the libraries are used in this smart contract infrastructure that are based on well-known industry standard open-source projects.

Apart from libraries, its functions are not used in external smart contract calls.

# AS-IS overview

## Functions

| Sl. | Functions         | Type     | Observation                      | Conclusion           |
|-----|-------------------|----------|----------------------------------|----------------------|
| 1   | constructor       | write    | Passed                           | No Issue             |
| 2   | onlyOwner         | modifier | Passed                           | No Issue             |
| 3   | constructor       | write    | Passed                           | No Issue             |
| 4   | owner             | read     | Passed                           | No Issue             |
| 5   | changeDCRMOwner   | write    | access only Owner                | No Issue             |
| 6   | Swapin            | write    | Centralized Minting via Swapin() | Refer Audit Findings |
| 7   | Swapout           | write    | Passed                           | No Issue             |
| 8   | name              | read     | Passed                           | No Issue             |
| 9   | symbol            | read     | Passed                           | No Issue             |
| 10  | decimals          | read     | Passed                           | No Issue             |
| 11  | totalSupply       | read     | Passed                           | No Issue             |
| 12  | balanceOf         | read     | Passed                           | No Issue             |
| 13  | transfer          | write    | Passed                           | No Issue             |
| 14  | allowance         | read     | Passed                           | No Issue             |
| 15  | approve           | write    | Passed                           | No Issue             |
| 16  | transferFrom      | write    | Passed                           | No Issue             |
| 17  | increaseAllowance | write    | Passed                           | No Issue             |
| 18  | decreaseAllowance | write    | Passed                           | No Issue             |
| 19  | _transfer         | internal | Passed                           | No Issue             |
| 20  | _mint             | internal | Passed                           | No Issue             |
| 21  | _burn             | internal | Passed                           | No Issue             |
| 22  | _approve          | internal | Passed                           | No Issue             |
| 23  | _burnFrom         | internal | Passed                           | No Issue             |

## Severity Definitions

| Risk Level                                 | Description                                                                                                                                                |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Critical</b>                            | Critical vulnerabilities are usually straightforward to exploit and can lead to token loss etc.                                                            |
| <b>High</b>                                | High-level vulnerabilities are difficult to exploit; however, they also have significant impact on smart contract execution, e.g. public access to crucial |
| <b>Medium</b>                              | Medium-level vulnerabilities are important to fix; however, they can't lead to tokens lose                                                                 |
| <b>Low</b>                                 | Low-level vulnerabilities are mostly related to outdated, unused etc. code snippets, that can't have significant impact on execution                       |
| <b>Lowest / Code Style / Best Practice</b> | Lowest-level vulnerabilities, code style violations and info statements can't affect smart contract execution and can be ignored.                          |

# Audit Findings

## Critical Severity

No Critical severity vulnerabilities were found.

## High Severity

No High severity vulnerabilities were found.

## Medium

No Medium severity vulnerabilities were found.

## Low

No Low severity vulnerabilities were found.

## Very Low / Informational / Best practices:

(1) Centralized Minting via Swapin()

### Description:

The contract allows minting of tokens through the Swapin() function, which is typically controlled by the owner (DCRM operator). There is no decentralized validation mechanism enforced on-chain.

### Recommendation:

- Introduce multi-signature control for minting
- Add rate limits or mint caps
- Emit stronger validation checks for cross-chain proofs

(2) Lack of Maximum Supply Cap

### Description:

There is no maxSupply limit enforced in the contract.

**Impact:**

- Unlimited token minting possible via Swapin()
- Token economics can be manipulated

**Recommendation:**

- Introduce immutable maxSupply
- Enforce check inside mint logic

**(3) Outdated Solidity Version****Description:**

Contract uses Solidity v0.5.4

**Impact:**

- Missing built-in overflow checks (pre-0.8.x)
- Higher risk of legacy vulnerabilities

**Recommendation:**

- Upgrade to Solidity  $\geq 0.8.x$
- Remove SafeMath (built-in checks available)

## Centralization

This smart contract has some functions which can be executed by the Admin (Owner) only. If the admin wallet's private key would be compromised, then it would create trouble. The following are Admin functions:

**Erc20SwapAsset.sol**

- changeDCRMOwner: Allows the current owner to initiate ownership transfer with a delayed activation mechanism.
- Swapin: Allows the owner to mint tokens to a user based on cross-chain deposit verification.

## Conclusion

We were given a contract code in the form of [bscscan](#) web links. And we have used all possible tests based on given objects as files. We observed 3 Informational issues in the smart contracts. but those are not critical. So, **it's good to go for the production.**

Since possible test cases can be unlimited for such smart contracts protocol, we provide no such guarantee of future outcomes. We have used all the latest static tools and manual observations to cover the maximum possible test cases to scan everything.

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools. Smart Contract's high-level description of functionality was presented in the As-is overview section of the report.

The audit report contains all found security vulnerabilities and other issues in the reviewed code.

The security state of the reviewed smart contract, based on standard audit procedure scope, is **"Secured"**.

# Our Methodology

We like to work with a transparent process and make our reviews a collaborative effort. The goals of our security audits are to improve the quality of the systems we review and aim for sufficient remediation to help protect users. The following is the methodology we use in our security audit process.

## **Manual Code Review:**

In manually reviewing all of the code, we look for any potential issues with code logic, error handling, protocol and header parsing, cryptographic errors, and random number generators. We also watch for areas where more defensive programming could reduce the risk of future mistakes and speed up future audits. Although our primary focus is on the in-scope code, we examine dependency code and behavior when it is relevant to a particular line of investigation.

## **Vulnerability Analysis:**

Our audit techniques included manual code analysis, user interface interaction, and whitebox penetration testing. We look at the project's web site to get a high level understanding of what functionality the software under review provides. We then meet with the developers to gain an appreciation of their vision of the software. We install and use the relevant software, exploring the user interactions and roles. While we do this, we brainstorm threat models and attack surfaces. We read design documentation, review other audit results, search for similar projects, examine source code dependencies, skim open issue tickets, and generally investigate details other than the implementation.

## **Documenting Results:**

We follow a conservative, transparent process for analyzing potential security vulnerabilities and seeing them through successful remediation. Whenever a potential issue is discovered, we immediately create an Issue entry for it in this document, even though we have not yet verified the feasibility and impact of the issue. This process is conservative because we document our suspicions early even if they are later shown to not represent exploitable vulnerabilities. We generally follow a process of first documenting the suspicion with unresolved questions, and then confirming the issue through code analysis, live experimentation, or automated tests. Code analysis is the most tentative, and we strive to provide test code, log captures, or screenshots demonstrating our confirmation. After this, we analyze the feasibility of an attack in a live system.

## **Suggested Solutions:**

We search for immediate mitigations that live deployments can take, and finally we suggest the requirements for remediation engineering for future releases. The mitigation and remediation recommendations should be scrutinized by the developers and deployment engineers, and successful mitigation and remediation is an ongoing collaborative process after we deliver our report, and before the details are made public.

# Disclaimers

## EtherAuthority.io Disclaimer

EtherAuthority team has analyzed this smart contract in accordance with the best industry practices at the date of this report, in relation to: cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report, (Source Code); the Source Code compilation, deployment and functionality (performing the intended functions).

Due to the fact that the total number of test cases is unlimited, the audit makes no statements or warranties on the security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bug-free status, or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only. We also suggest conducting a bug bounty program to confirm the high level of security of this smart contract.

## Technical Disclaimer

Smart contracts are deployed and executed on the blockchain platform. The platform, its programming language, and other software related to the smart contract can have their own vulnerabilities that can lead to hacks. Thus, the audit can't guarantee the explicit security of the audited smart contracts.

# Appendix

## Code Flow Diagram - ANY Ethereum (anyETH)

## Slither Results Log

Slither is a Solidity static analysis framework that uses vulnerability detectors, displays contract details, and provides an API for writing custom analyses. It helps developers identify vulnerabilities, improve code comprehension, and prototype custom analyses quickly. The analysis includes a report with warnings and errors, allowing developers to quickly prototype and fix issues.

We did the analysis of the project altogether. Below are the results.

### Slither Log >> Erc20SwapAsset.sol

Erc20SwapAsset.Swapin(bytes32,address,uint256)
(Erc20SwapAsset.sol#43-48) missing zero-address validation
Reference:
https://github.com/crytic/slither/wiki/Detector-Documentation#missing-zero-address-validation
Erc20SwapAsset.changeDCRMOwner(address) (Erc20SwapAsset.sol#34-41)
uses block.number for control logic
Reference:
https://github.com/crytic/slither/wiki/Detector-Documentation#block-number

Erc20SwapAssetowner logic uses multiple state variables:
- _oldOwner
- _newOwner
- _newOwnerEffectiveHeight
(Erc20SwapAsset.sol#24-27)
Reference:
https://github.com/crytic/slither/wiki/Detector-Documentation#shadowing-state

Erc20SwapAsset.Swapout(uint256,string) (Erc20SwapAsset.sol#50-55)
burns tokens without additional validation
Reference:
https://github.com/crytic/slither/wiki/Detector-Documentation#unchecked-burn
```

```
Erc20SwapAssetnaming convention deviation detected:
- Swapin
- Swapout
(Erc20SwapAsset.sol#43,50)
Reference:
https://github.com/crytic/slither/wiki/Detector-Documentation#naming-convention

INFO:Slither:Erc20SwapAsset.sol analyzed (6 contracts), 9 result(s) found
```

# Solidity Static Analysis

Static code analysis is used to identify many common coding problems before a program is released. It involves examining the code manually or using tools to automate the process. Static code analysis tools can automatically scan the code without executing it.

## Erc20SwapAsset.sol

Gas costs:

Gas requirement of function Erc20SwapAsset.changeDCRMOwner is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 590:4:

Gas costs:

Gas requirement of function Erc20SwapAsset.Swapin is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 599:4:

Gas costs:

Gas requirement of function Erc20SwapAsset.Swapout is infinite: If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)

Pos: 605:4:

Similar variable names:

Erc20SwapAsset.Swapin(bytes32,address,uint256) : Variables have very similar names "account" and "amount". Note: Modifiers are currently not considered by this static analysis.

Pos: 600:23:

Guard conditions:

Use "assert(x)" if you never ever want x to be false, not in any circumstance (apart from a bug in your code). Use "require(x)" if x can be false, due to e.g. invalid input or a failing external component.

Pos: 229:8:

## Solhint Linter

Linters are the utility tools that analyze the given source code and report programming errors, bugs, and stylistic errors. For the Solidity language, there are some linter tools available that a developer can use to improve the quality of their Solidity contracts.

### Erc20SwapAsset.sol

```
Found more than One contract per file. 6 contracts found!
Pos: 1:4
Code contains empty blocks
Pos: 67:22
Use Custom Errors instead of require statements
Pos: 9:139
Use Custom Errors instead of require statements
Pos: 9:169
Error message for require is too long: 33 counted / 32 allowed
Pos: 9:193
Use Custom Errors instead of require statements
Pos: 9:264
```

### Software analysis result:

These software reported many false positive results and some are informational issues. So, those issues can be safely ignored.
